

# BION INSTITUTE: THE INFLUENCE OF THE SPIRITUAL TEACHER SANDI DOLINAR ON WATER

*The most unusual property of water is its memory. Over the past twenty years a lot of research has been done which has more or less successfully confirmed that water in fact carries memory.*

Water is the basis of life on planet Earth. Despite its seeming simplicity, neither physicists nor chemists today know all the secrets of water. Notwithstanding the interesting and unusual properties of water which have been thoroughly researched by science, water still remains a big mystery.

The most unusual property of water is its memory. Over the past twenty years a lot of research has been done which has more or less successfully confirmed that water in fact carries memory. In Slovenia, the memory of water has been researched by BION research institute (Institute for Bioelectromagnetics and New Biology).

Applying original research approaches, physicists and biologists under the leadership of Prof. Dr Igor Jerman have proven that information records in water influence various corona parameters with the electrophotography of water drops, the growth of various cell cultures and the growth of sprouts immersed in such water.

Water memory is the basis for homeopathy and some other healing methods (for example healing with essences such as Bach flower remedies). Water memory is utilized so that information of the original chemical substance is transferred to the patient through water. That way, numerous side effects which might have been caused by the chemical substance and thus do more harm than good, can be avoided.

Science and conventional medicine are still relatively guarded when it comes to the memory of water. Even though many researchers have confirmed the existence of water memory, it remains unclear as to how it actually works. Some theories explain memory as a consequence of the property of grouping water molecules into clusters and clathrates, while other theories discuss it on the level of individual atoms and even quanta.

Dr. Igor Kononenko

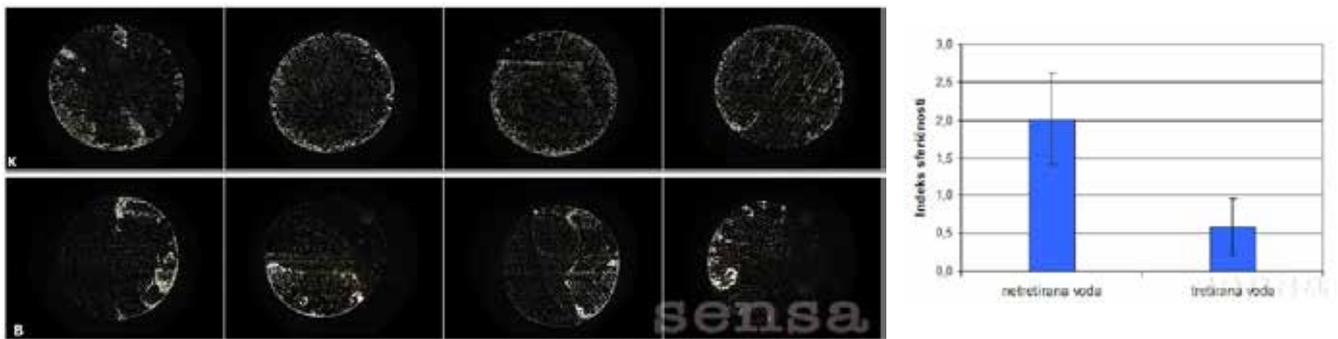

## Test of the energy influence of the spiritual teacher Sandi Dolinar with the use of the BionEvapo® method

Using the standardized BionEvapo® method, we research the changes in water structure which occur as a result of various factors. The method is based on monitoring the changes in the arrangement of residual mineral substances in water after the evaporation of water drops under controlled conditions. With microscopic examination we evaluate residual drops and using a special algorithm, determine their complexity and sphericity which show the differences between energetically treated and untreated water.

### Energy influence test on 3 different waters

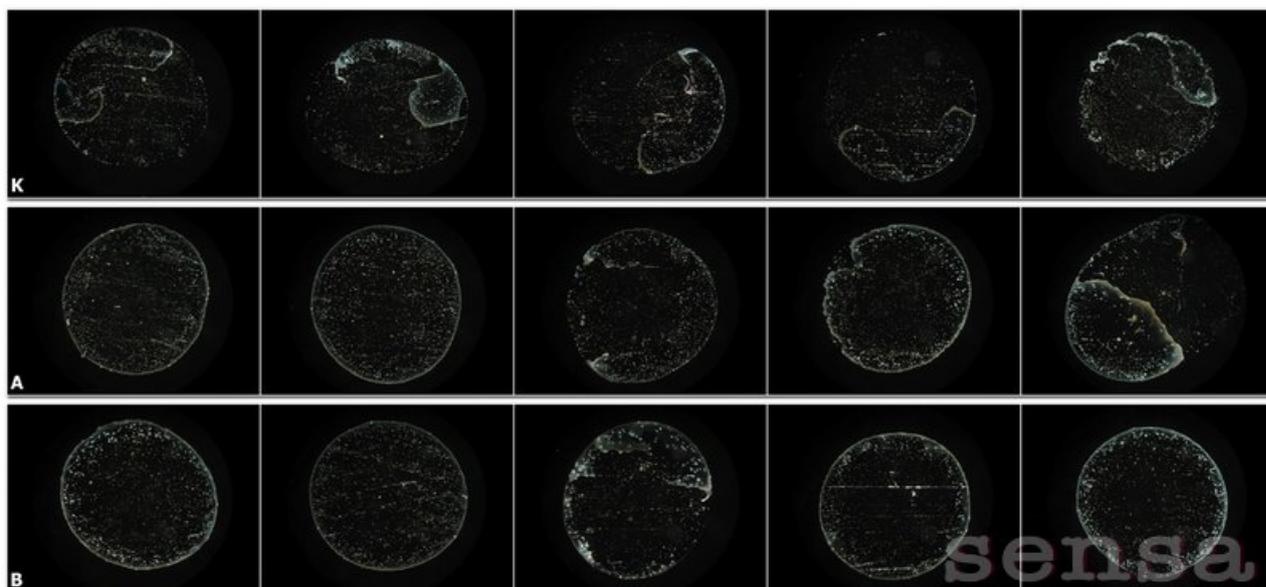

With the spiritual teacher Sandi Dolinar we set out to test energy influence on three different waters: tap water, mineral water with a high and mineral water with a low content of dissolved substances. Research reveals that the content of dissolved particles has a big impact on the way energy influence on water is expressed.

Mr Dolinar influenced water with his abilities by imprinting it with certain information or energy, while we monitored the change as it manifested itself in drops of water, and compared it to the control, unchanged water. Some of the results are presented next.

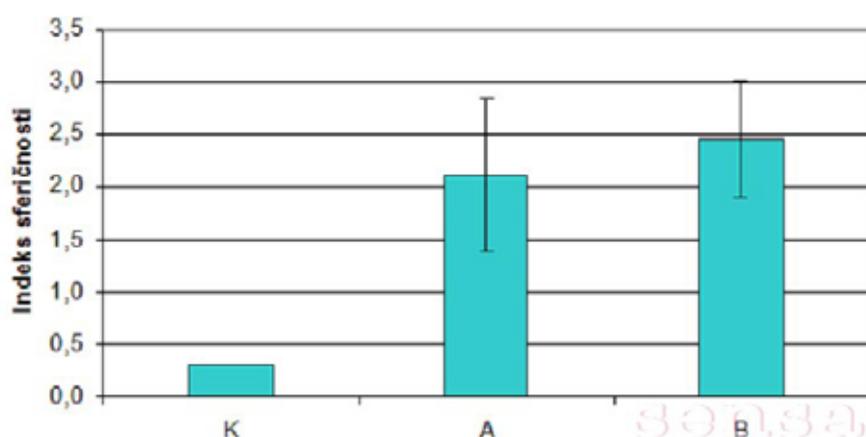

Picture 1: Residue of tap water drops. K – control (untreated water), B – treated water, Graph 1: Spherical index of control (untreated) and treated tap water

Picture 1 shows the comparison between untreated and treated tap water. The control water forms relatively regularly shaped drops with clearly defined edges. Energetically treated drops, on the other hand, haven't got clearly defined edges, and the majority of particles are concentrated in one part of a drop where folds and white condensation are also visible. The spherical index of the treated water is significantly lower than the spherical index of the control tap water (Graph 1), which clearly indicates Mr Sandi's energy influence on tap water.

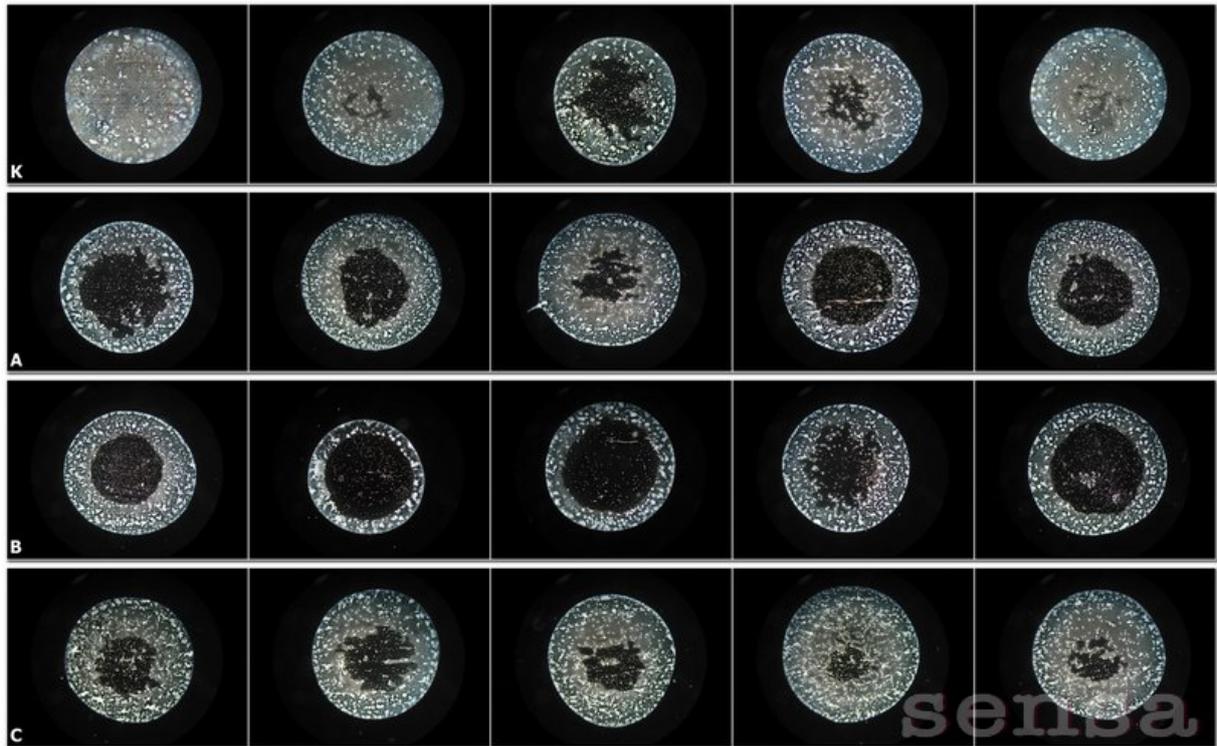

Picture 2: Residue of mineral water drops with a low content of dissolved particles. K – control, A and B – treatments carrying positive and negative messages

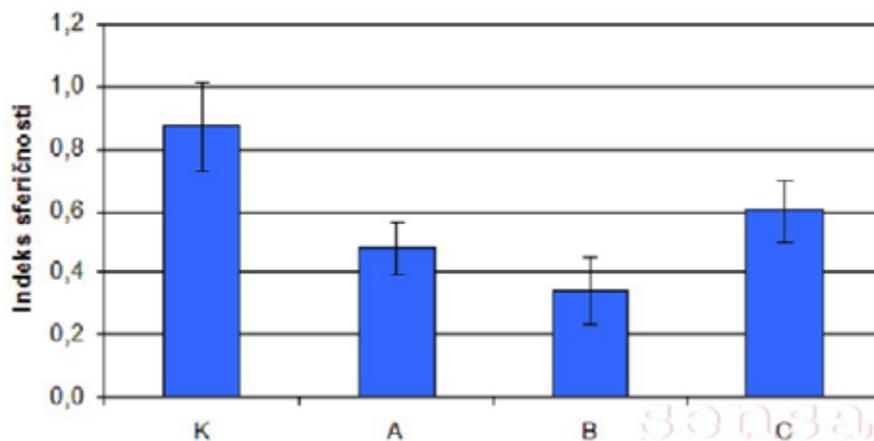

Graph 2: Spherical index of control (untreated) mineral water with a low content of dissolved substances and both treatments

Picture 2 shows the residue of mineral water drops with a low content of dissolved particles. Looking at control water, we see that it doesn't form drops with clearly defined edges, and most particles are concentrated in one part of a drop. Treatments A and B have changed the shape of dried droplets into a regular one, edges are clearly defined and in treatment B they are also reinforced. The spherical index is the highest in treatment B, and both treatments have significantly higher spherical indexes than the control (Graph 2), which again testifies to Sandi's energy influence on water.

Varying results from Sandi's treatment of tap water and mineral water also indicate that different types of water express man's energy influence differently.

Picture 3: Residue of mineral water drops with a high content of dissolved particles. K – control, A – positive message, B – energy carried a message to form the largest void possible in the centre, C – energy carried a message to form central structures

Graph 3: Spherical indexes of control mineral water with a high content of dissolved substances and all the treatments

Picture 3 shows the residue of water drops after different treatments in comparison with control, untreated mineral water with a high content of dissolved particles. A drop of water with a high content of dissolved particles usually forms an edge, a ring and a centre, which can be variously structured. The biggest difference can be seen in example B, where particles are shifted to the edge and form a compact ring while the central part remains empty. The other two treatments also differ from the control untreated water, the difference is significant in all cases, and Sandi's energy influence is confirmed once again. Treatments B

and C also show that drops of water have formed deposits in accordance with Sandi's message.

It can be concluded that with his influence, Mr Sandi Dolinar affects the structure of water, which has been demonstrated also in Pictures 1-3 and Graphs 1-3. In the case of water with a high content of dissolved particles we can also see a noticeable influence he has on the desired structure.

Dr Igor Jerman

## About Sandi Dolinar

Sandi is reluctant to talk about himself; he will much sooner explain what we need to change about ourselves in order to achieve our perfection. At Sensa we know him by his numerous innovative articles. He is the author of four successful books and a deck of cards. In the business community he is considered a successful businessman who has been active in the field of automobilism and industry for many years.

Sandi offers meditation classes every Tuesday in Stražišče, Kranj. Every week, his meditation class is attended by over 400 people who participate in several groups in order for everyone to fit into the community hall. Meditation classes are free of charge, because Sandi tries to enable everyone who is dedicated to working on themselves to receive optimal spiritual help and support. During his classes he explains that the spiritual world doesn't provide us with a magic wand for us to change the world, but rather gives us the strength and courage to change ourselves.

Sandi's spiritual abilities have been proven by various scientific tests carried out by the Bion Institute, which are also presented in our medium.
